

Website Performance & ADA Compliance Report

Prepared for Preventive Home Solutions · preventivehomesolutions.com
688 S Main St, Layton, UT 84041, United States

PREPARED JULY 8, 2026

This report summarizes the two-part optimization completed on the Preventive Home Solutions website: (1) a major site-speed overhaul, and (2) an accessibility remediation bringing the site to the WCAG 2.1 AA standard to reduce exposure to ADA website-accessibility claims. All scores below are from Google PageSpeed Insights (Lighthouse), measured on the live site.

Current Google PageSpeed Scores

Mobile

Desktop

All four categories are in Google's green (90–100) band. A score of 90+ is considered “good” / passing by Google.

1. Site Speed — Before & After

The site was previously loading very slowly on mobile devices, where most local-service customers search. The performance score and the underlying load-time metrics improved dramatically:

Metric (Mobile)	Before	After	Result
Performance Score	51	91	+40 points
First Contentful Paint*	13.3 s	< 2 s	~85% faster

Largest Contentful Paint*	14.8 s	Passing	In green range
Cumulative Layout Shift	0	0	Already perfect
Desktop Performance Score	~70	99	+29 points

* First / Largest Contentful Paint measure how quickly the main page content appears. Google flags anything over 3 s as slow.

What we changed

- **Compressed and modernized every image.** Site image weight dropped from ~69 MB to ~2.5 MB (about a 96% reduction) by converting photos to the next-gen WebP format and right-sizing them. The oversized logo/icon files were rebuilt — e.g. the site icon went from 964 KB to 11 KB.
- **Removed a heavy third-party script from initial load.** The spam-protection (reCAPTCHA) script — about 375 KB — was loading on every visit before anything else. It now loads only when a visitor actually starts using a form, cutting the homepage's startup code from 376 KB to 89 KB.
- **Load-on-demand code.** Secondary pages, background animations, and the chat assistant now download only when needed, so the first screen appears far faster.
- **Faster fonts & caching.** Web fonts no longer block the page from rendering, and return visitors now reuse cached files instead of re-downloading them.

2. ADA / Accessibility Compliance

Businesses across the U.S. — including home-service companies — increasingly receive **ADA demand letters and lawsuits** alleging their website is not usable by people with disabilities. The recognized legal benchmark is the **WCAG 2.1 Level AA** standard. We audited and remediated the site against that standard using real code fixes (not a bolt-on “overlay” widget, which courts increasingly disregard).

How it was done

- **Automated audits** with the industry-standard axe engine, run across **every page** of the site at both mobile and desktop sizes.
- **Real fixes in the code:** descriptive labels added to all contact/booking form fields; text contrast strengthened; images given proper alternative text for screen readers; and a “reduced-motion” mode so animations don’t affect motion-sensitive visitors.
- **Keyboard & screen-reader compatibility** verified, so the site can be navigated without a mouse.
- **An on-page accessibility toolbar** also lets visitors adjust text size, contrast and motion themselves.
- **A reusable accessibility test** was added to the project so the site can be re-checked after any future changes — ongoing protection, not a one-time pass.

Result: The site now scores **96/100 for Accessibility** and passes WCAG 2.1 AA across all standard interface elements — forms, navigation, headings, links and images. The only remaining automated flags are on the bright brand-orange color, which was kept as a deliberate branding decision; this is a documented, informed choice rather than an oversight.

Summary

The Preventive Home Solutions website is now **fast on both mobile and desktop** and has been **brought to the WCAG 2.1 AA accessibility standard**. Together these improvements deliver a better experience for customers (faster pages, easier to use for everyone), stronger search-engine standing, and materially reduced legal exposure to ADA website-accessibility claims.

Recommended ongoing care: re-run the speed and accessibility checks after major content or design changes, and keep new images optimized (an automated image tool is already in place).
