

IMPLEMENTATION REPORT

Accessibility Widget & Website Analytics

A summary of two updates now live on your site: a refined accessibility toolbar, and full conversion tracking that shows how visitors call, click, and request quotes.

PREPARED FOR	DATE	SCOPE	STATUS
Preventive Home Solutions	July 10, 2026	Accessibility · GA4	Built & verified

01 **Accessibility Widget**

Your site has a built-in accessibility toolbar — a floating button that lets any visitor adjust the page to suit their needs. In this update its launcher button was reshaped from a circle to a **square**, so it matches the site's signature squared-off, heavy-duty look instead of standing out as the only round element on the page.

What visitors can adjust

T Text size Scale all page text from 90% up to 150% in one-tap steps.	ⓘ High contrast Boosts color contrast for easier reading in bright light or low vision.
T Readable font Switches to a highly legible typeface with extra letter spacing.	🔗 Highlight links Underlines and outlines every link so they're easy to find.
👉 Bigger cursor Enlarges the mouse pointer for visitors with motor or vision needs.	⏸ Pause animations Stops on-page motion for visitors sensitive to movement.

A **Reset all** button clears every adjustment in one tap.

How it's built

These are **real, native adjustments** — not a bolted-on third-party overlay. That means it's fast, doesn't slow the site down, and won't conflict with the design.

Whatever a visitor selects is **remembered** as they move between pages and when they return later.

Accessibility posture

The toolbar is fully keyboard-operable and works with screen readers, complementing the WCAG 2.1 AA work already done across the site.

Good to know: user-facing tools like this improve real-world accessibility and demonstrate good-faith effort, but no widget alone is a legal guarantee of ADA/WCAG compliance.

02

Website Analytics (Google Analytics 4)

The site now measures the actions that actually matter to your business — phone calls, quote requests, and button clicks — using Google Analytics 4. Tracking is wired in **once, centrally**, so it automatically covers every form and call-to-action across the whole site, including the new Plumbing, Heating, and Air Conditioning landing pages.

● EVENTS TESTED & CONFIRMED FIRING IN A VERIFICATION BUILD

WHAT GETS TRACKED

EVENT	FIRES WHEN...	WHAT IT CAPTURES
page_view	A visitor opens or moves to any page	Page address & title (correctly counts every page in this single-page site)
generate_lead	A quote/contact form is submitted successfully	Which form & page, the service requested, residential vs. commercial
click_to_call	A visitor taps a phone number	The number dialed and where it was clicked
email_click	A visitor taps an email address	The email link that was clicked
cta_click	A visitor clicks a call-to-action button	Button label (e.g. "Get Free Quote"), destination & page

The two events worth watching most closely — generate_lead and click_to_call — are your primary conversions.

How it works

It uses Google's standard **gtag.js** — the same tool GA4 recommends. Analytics loads only when a Measurement ID is present, so nothing is tracked during testing or if the ID is ever removed.

No sensitive data is exposed, and the setup follows the exact same secure pattern already used for the site's spam protection.

What you'll see in GA4

Realtime activity as it happens, an **Events** report listing every action above, and **conversions** once the key events are marked.

You can then see a full funnel: page view → button click → quote request.

TO SWITCH IT ON — ONE-TIME SETUP

1 Create a GA4 property

At analytics.google.com, create a property and add a "Web" data stream for preventivehomesolutions.com.

2 Copy the Measurement ID

It looks like `G-XXXXXXXXXX`. This is all we need — no code changes required.

3 Add it to the site's settings

In Vercel → Project Settings → Environment Variables, add `VITE_GA_MEASUREMENT_ID` with that value, then redeploy. (We can do this step for you.)

4 Mark your key events as conversions

In GA4 → Admin → Events, flag `generate_lead` and `click_to_call` as **Key events** so they report as conversions.

Send us the Measurement ID and we'll finish steps 3–4 and confirm data is flowing in your GA4 dashboard.
